When using an impressed current cathodic protection system to protect a steel UST system from corrosion, it must be active constantly — 24 hours per day, 7 days per week, every day of the year. In addition, the system must be inspected a minimum of every 60 days and those results must be maintained for at least six months.

Tanknology® has the perfect solution for keeping you in compliance with these state and federal monitoring laws, it’s our Automatic Rectifier Compliance (ARC) system.

Continuous Monitoring
ARC is a wireless communications device that is incorporated into your cathodic protection program. The system continuously monitors the critical electrical readings and wirelessly transmits the data to the Tanknology ARC monitoring center. The utilization of wireless technology eliminates the need and expense associated with a dedicated monitoring phone line.

Real-Time Reporting
When the system generates an alarm, detailed reports are provided and notification occurs through your choice of e-mail, text message, pager, or FAX. The system can be customized to query the site monthly, weekly, or daily, depending upon your preference.

Lease-To-Own
Through Tanknology’s attractive lease-to-own program, full equipment ownership can be attained in just one year, through small monthly payments.
